

Application of optical fiber cable for underground temperature measurement in Yemen

Overview

This report summarizes distributed fiber optic-based temperature measurement technologies and how this type of technology can be applied to underground power cables through case studies, implementation strategies, and technical details of applying these systems. The monitoring system demonstrated herein uses Fiber Bragg Grating (FBG) sensors to measure multiple parameters, such as the distributed temperature of the power cable. Fiber optic temperature sensors are immune to the many environmental effects that compromise other measurement technologies, can be embedded and installed in locations traditional temperature sensors cannot and deliver an unprecedented level of spatial detail and data without sacrificing precision.
