

Austrian Bending-Insensitive Fiber Intelligent

Overview

It has low macro-bending sensitivity and low water-peak level. Enter bend-insensitive fiber (BIF)—a revolutionary design that minimizes loss even in tight bends, transforming how fiber is deployed in high-density, space-constrained environments. Heraeus fluorine-doped tubes are a flexible and highly productive solution to achieve such fiber design. Since about 20 years ago, Heraeus has shaped the industry with. YOFC EasyBand[®] bending insensitive single-mode fibre encompasses all the features of FullBand[®] fibre and provides good resistance to macro-bending. A2) are a crucial part of the world's shift towards flexible and reliable connectivity. When stressed by bending, light in the outer part of the core is no longer guided in the core of the fiber so some is lost, coupled from the core into the cladding, creating a higher loss in the stressed section of the fiber. If you put a YOFC EasyBand[®] Ultra fibre is designed specifically for Fibre-To-The-Home (FTTH), enterprise network and any other applications where ultra low bending-loss at small bending radii is needed.
