

Build the base of the distribution box

Article Overview

The base of a distribution box is built by selecting a sturdy enclosure, installing mounting supports, and preparing a secure platform for breakers and busbars.

Step 1: Choose the Enclosure

Select a steel or durable plastic enclosure that fits your system's size and electrical load requirements. Ensure it has enough depth and width to accommodate all breakers, busbars, and wiring channels while leaving space for ventilation and future expansion .

Step 2: Prepare the Mounting Surface

- Level the base: Place the enclosure on a flat, stable surface or wall mount it securely.
- Install mounting supports: Use brackets or rails to hold the main and branch breakers in place. These supports prevent movement and ensure proper alignment of components .

Step 3: Install the Busbar System

- Use a modular busbar system or traditional copper busbars depending on your design.
- Secure the busbars to the base using insulated supports to prevent short circuits.
- Ensure proper spacing for each breaker connection to allow safe wiring and heat dissipation
