

Cable tray tee cannot be covered

Article Overview

Cable tray tees typically cannot be covered due to their three-connector design and the need for on-site modifications to maintain proper cable routing and airflow.

Design and Installation Considerations

A cable tray tee is designed to connect three tray runs at a junction point. Unlike straight or branch pieces, the tee requires three connectors to maintain structural integrity and proper cable support. Covering a tee is often impractical because the upturned edges of the main tray intersect the throat of the take-off, making a solid cover difficult to fit without modification. Attempting to cover a tee can interfere with cable placement, airflow, and heat dissipation.

Airflow and Heat Dissipation

Cable trays, especially ladder-type trays, are often left uncovered to maximize airflow and dissipate heat generated by current-carrying conductors. Covering a tee could restrict ventilation, leading to overheating and potential damage to cables. Ladder trays without covers also minimize dust accumulation and prevent moisture from collecting, which is particularly important at junctions like tees.

Practical Workarounds

In real-world installations, some companies use branch pieces instead of tees to simplify connections. These branch pieces typically have only one connector and require the main tray to be modified on-site, such as chopping the upstand edge to...
