

Can you see the grating etched on the optical fiber

Overview

A fiber Bragg grating is a sensor etched into a fiber optic cable. This animation shows the basic operating principle. At one temperature (say, 20 degrees Celsius), the grating allows all wavelengths except a narrow band (in this example, green light) to pass through. A fiber Bragg grating (FBG) is a type of distributed Bragg reflector constructed in a short segment of optical fiber that reflects particular wavelengths of light and transmits all others. In most OFSCN® products, such as the OFSCN® Polyacrylate Fiber Bragg Gratings or OFSCN® Polyimide Fiber Bragg Press the play button to see the animation. It provides an expert-curated supplier directory, buyer-focused technical background information, and structured selection criteria to support professional procurement decisions.
