

Carrier Level 1 Optical Distribution Box

Article Overview

A Carrier Level 1 Optical Distribution Box is a fiber optic enclosure used to manage, protect, and distribute optical fibers from feeder cables to drop cables in FTTH networks.

Overview

A Level 1 Optical Distribution Box (ODB) serves as the first point of distribution in a fiber optic network, typically connecting feeder cables from the central office (CO) to optical splitters or directly to subscriber drop cables . It is designed to provide secure fiber management, protection against environmental factors, and easy access for maintenance.

Key Functions

- **Fiber Termination and Splicing:** Houses splice trays for fusion or mechanical splicing, ensuring proper slack storage, bend-radius compliance, and stress relief .
- **Distribution to Splitters:** Connects feeder fibers to Level 1 optical splitters, which may then cascade to Level 2 splitters or directly to subscribers .
- **Pre-Connection Capability:** Many modern Level 1 boxes support pre-terminated fiber plugs, allowing quick and reliable connections without exposing fibers to the environment .
- **Port Management:** Supports multiple output ports, commonly ranging from 4 to 48 ports, depending on network design and subscriber density .
