

Case Study of Thermally Sealed Aisle Computer Room

Overview

This study analyzes the IT environment of the hot aisle containment (HAC) system, which has been considered an essential solution for high-density data centers. “The installation of Daxten's containment solution at the end of the rack aisles was a key factor in eliminating temperature differences in our environment,” said Simon Levey, Data Centre Development Specialist at Fujitsu UK. Steel frame kits with telescopic beams, roof panels, and sliding doors, configured to non-standard aisle widths, installed live with no downtime, cutting cooling energy roughly. The document discusses hot aisle and cold aisle containment strategies for data centers, highlighting their importance in improving airflow management and energy efficiency. Through the use of computational fluid dynamics (CFD) simulations, three different airflow strategies were evaluated and improved: underfloor precision air conditioning, inter-column air conditioning, and backplane air conditioning. While newer technologies address higher density requirements, CRAC.
