

Configuration of distribution box parameters and specifications

Article Overview

A distribution box is configured based on rated voltage, current, incoming/outgoing circuits, protective devices, and optional smart features to ensure safe and efficient power distribution.

Key Electrical Parameters

The primary configuration parameters include rated voltage and rated current, which define the maximum operating limits of the distribution box. The incoming line circuit breaker is specified with its model and rated breaking current to protect the system from overloads or short circuits. Outgoing circuits are configured according to the load requirements, with each circuit protected by appropriate Miniature Circuit Breakers (MCBs) or Residual Current Circuit Breakers (RCCBs) to ensure safety and reliability .

Components and Functional Configuration

A typical distribution box includes:

- Incoming Line Part: Can be single or dual lines, with dual power switches enabling automatic switching to backup power if the main supply fails .
- Circuit Breakers: Protect individual circuits from overloads and short circuits .
- RCCBs: Detect imbalances between phase conductors for enhanced safety .
- Isolators: Manually operated switches to isolate circuits for maintenance
