

Cut fiber optic cold connectors

Article Overview

A fiber optic cold connector allows quick, field-ready termination by stripping, cutting, and snapping the fiber into a connector without fusion splicing.

Tools and Materials Needed

- Fiber optic cold connector kit (includes connector, snap rings, and cutting knife)
- Fiber stripper
- Alcohol wipes or cotton
- Cleaver or precision cutting tool
- Protective gloves and safety glasses

Step-by-Step Procedure

- **Install the Cold Connector** Place the cold connector in a stable position and ensure the snap rings on both sides are open. Snap down the middle slot to prepare for fiber insertion .
- **Strip the Fiber** Remove about 3 cm of the outer jacket from the fiber using a fiber stripper. Carefully expose the bare fiber without nicking the glass. Clean the stripped fiber with alcohol to remove any contaminants .
- **Cut the Fiber** Insert the fiber into the cutting knife or cleaver and cut approximately 1.4 cm of the fiber. Ensure the cut is clean and perpendicular to the fiber axis to minimize optical loss .
- **Insert the Fiber into the Connector** Snap the bare fiber into the middle snap ring of the cold connector. Push the side snap rings tightly to secure the fiber. Repeat the stripping, cleaning, and cutting process for the other fiber end and insert it into the opposite side of the connector
