

Direct connection of optical port router to fiber optic cable

Article Overview

You generally cannot connect a fiber optic cable directly to a standard home router; an Optical Network Terminal (ONT) or a compatible SFP module is required to convert the optical signal into an electrical signal your router can use.

Why Direct Connection Usually Doesn't Work

Fiber optic cables transmit data as light signals, which standard routers cannot interpret directly. The signal must first be converted into an electrical format compatible with Ethernet ports. This conversion is typically handled by an Optical Network Terminal (ONT) provided by your ISP, which serves as the interface between the fiber network and your home network . Without this conversion, the router cannot process the incoming data.

Standard Setup

- Install the ONT: Connect the fiber cable from the wall outlet to the ONT's optical port. Power on the ONT and wait for the status lights to stabilize .
- Connect the ONT to the Router: Use a high-quality Ethernet cable (Cat6a or higher) to link the ONT's Ethernet port to your router's WAN port .
- Configure the Router: Access the router's admin panel and enter any ISP credentials if required. This ensures your router can communicate with the internet through the ONT .
