

EU Network Cable Tray Specifications

Article Overview

EU network cable trays are standardized support systems designed to safely route and protect electrical and communication cables, typically made of steel or stainless steel, with various coatings and configurations to meet European standards.

Materials and Coatings

EU cable trays are commonly manufactured from hot-dip galvanized steel, stainless steel (AISI 316L), or aluminum, providing durability and corrosion resistance for indoor and outdoor applications . Coatings may include pre-galvanization, powder coating, or epoxy finishes to enhance protection against environmental factors . Aluminum trays offer a high resistance-to-weight ratio and excellent corrosion resistance, while stainless steel is preferred in highly corrosive or marine environments .

Types and Configurations

Cable trays are available in several types to suit different installation needs:

- Ladder trays: Open design for heavy-duty cables, allowing ventilation and heat dissipation .
- Perforated trays: Provide airflow while supporting medium-weight cables .
- Solid-bottom trays: Protect sensitive cables from dust, debris, or electromagnetic interference .
- Mesh or wire trays: Flexible routing for light instrumentation and control cables .
- Specialized trays: NATO-type or industrial trays for specific applications
