

Fabrication of Ladder-Type Cable Trays

Article Overview

Ladder-shaped cable trays are constructed using modular, tubular steel or aluminum components designed to support and organize electrical and data cables safely and efficiently.

Materials and Structure

Ladder trays are typically made from 16-gauge steel tubing or aluminum, forming two longitudinal rails connected by evenly spaced rungs, creating a ladder-like structure. This design provides mechanical support and strain relief for long cable runs while allowing air circulation to prevent overheating. The rungs are spaced to accommodate cable bundles and maintain structural integrity under load. Finishes often include powder-coated gray or black to resist corrosion and complement equipment aesthetics.

Design Considerations

When constructing ladder trays, consider the following:

- **Load Class and Span:** The tray's width and rung spacing define its load-carrying capacity for a given support span. Heavier cable loads require closer support spacing and stronger materials.
- **Compatibility:** Ensure all components, including fittings and supports, are designed and tested as a system to maintain safety and performance.
- **Deflection Limits:** Check that the tray does not exceed manufacturer-specified deflection limits under load
