

Fiber Optic Cable Bridge Mount

Article Overview

Fiber optic cable bridge mounts secure, guide, and protect fiber optic cables on bridges, using specialized brackets, blocks, and clips designed for structural and aerial installations.

Types of Fiber Optic Mounts for Bridges

1. **Fiber Optic Brackets and Clips** Fiber optic brackets provide a secure and organized way to mount cables along bridge structures. They prevent cable movement, reduce stress, and protect splices from environmental damage. Clips and brackets can be installed using screws, adhesive pads, or clip-on mechanisms, and are compatible with various cable diameters, typically ranging from 2.7 mm to 4.2 mm for splices . These mounts are suitable for telecom, datacom, and industrial applications. 2. **Pole and Structural Mounts** For bridges, fiber optic mounts often include pole or structural brackets that attach to beams, poles, or suspension cables. These mounts may feature cleats to prevent rotation and are made from durable materials such as ductile iron, aluminum, or fiberglass with UV protection . They are designed to withstand environmental stress and provide long-term support for aerial or suspended fiber optic cables. 3. **Stringing Blocks and Anti-Twisting Devices** During installation, fiber optic cables may pass through stringing blocks or quad blocks to guide the cable along the bridge while maintaining a safe pulling radius. These blocks often include rollers or arched rods to allow gradual turns and prevent twisting, with load capacities up to 5,000 lbs and maximum cable diameters around 1.5 inches . Pole mount frames and insulator brackets are used to attach these blocks securely to bridge structures....
