

Fiber Optic Cable Junction Box Fusion Steps

Article Overview

Fusion splicing in a fiber optic junction box involves careful preparation, precise cleaving, splicing with a fusion splicer, and secure placement of fibers to ensure low-loss, durable connections.

1. Safety and Workspace Preparation

Before starting, ensure personal protection: wear high-rated safety goggles and cut-resistant gloves to prevent injury from glass shards. Use anti-static mats or wrist straps to protect sensitive splicer electronics. Verify that the fusion splicer is clean, electrodes are in good condition, and power supply is stable .

2. Cable and Fiber Preparation

- Strip the outer jacket of the fiber optic cable using a cable stripper, exposing the buffer tube.
- Strip the fiber coating carefully (typically 250µm for single-mode fibers) without bending or twisting the fiber. Recommended strip length is 10–20 mm depending on the splicer specifications .
- Clean the fiber ends with lint-free wipes soaked in 99%+ isopropyl alcohol, wiping from the coating edge to the cleave tip in a single stroke. Use a fiber cleaning pen for stubborn residues .

3. Fiber Cleaving...
