

Fiber optic cable cooling in winter

Overview

The short answer: Fiber handles weather better than copper or satellite because it carries data as pulses of light instead of electrical signals. Cold isn't the real threat: The glass strands rarely freeze, but moisture that seeps into connectors can freeze and cause damage. Cold weather can affect fiber optic cables, but they are generally more resilient to temperature extremes compared to other types of cables, such as copper. As businesses increasingly rely on robust digital communications, understanding the environmental factors affecting fiber optic cables, particularly. Designed to be safe, fast and effective, even on tough terrain, the "Tornado" cable blowing machine will move fiber optic cable of 0.84-32 mm) diameter at speeds to 300 ft.) into pre-installed innerduct or direct-buried duct.
