

Fiber optic cable directly connected to the switch in the local area network

Overview

Choose an SFP module based on the fiber optic cabling that will be connected to the network switches. Most modern fiber-enabled network switches require an SFP transceiver module. Here fiber connects the desktop directly without the electronics in the telecom closet (renamed telecom room in later versions of the standard). Ethernet ports are designed for copper cables (like Cat5e or Cat6), which transmit data using electrical signals. It offers remarkable characteristics such as high bandwidth capacity, immunity to electromagnetic interference, low latency. The short answer is no - RJ45 connectors are designed for electrical Ethernet signals, while fiber optics transmit light pulses through glass or plastic. However, modern networks often combine both technologies.
