

Fiber-to-electric module plugged into a regular router

Article Overview

A fiber-to-electric module (media converter) allows you to connect a fiber optic line to a router via Ethernet, enabling standard network devices to access fiber internet.

How It Works

A fiber-to-electric module, also called a media converter, converts optical signals from a fiber optic cable into electrical signals that can be transmitted over standard Ethernet cables. This allows your router or switch to interface with a fiber internet connection without requiring a built-in fiber port . Many converters support gigabit speeds and can handle single-mode or multi-mode fiber depending on your network setup .

Components and Setup

- **Media Converter:** Receives the fiber input and outputs Ethernet. Some kits include SFP transceivers for hot-swappable fiber modules .
- **Router:** Connects to the Ethernet output of the media converter. Any standard router with an Ethernet WAN port can be used.
- **Fiber Cable:** Pre-terminated LC or SC fiber cables connect the ISP's fiber line to the media converter .
- **Power Supply:** Media converters typically include a power adapter; some industrial-grade models support wide temperature ranges and wall/desktop mounting .
