

Galvanized cable tray specifications and materials

Article Overview

Galvanized cable trays are primarily made from steel coated with zinc, available in pre-galvanized and hot-dip galvanized forms, offering varying levels of corrosion resistance for indoor and outdoor applications.

Types of Galvanized Cable Trays

- **Pre-Galvanized Steel Trays (PG)** These trays are made from steel sheets that are zinc-coated before fabrication. The coating is typically 12-20 microns thick (Z120-Z275), providing basic corrosion protection suitable for indoor environments such as offices or clean factories. Pre-galvanized trays are cost-effective but may show rust within 6-12 months if used outdoors .
- **Hot-Dip Galvanized Steel Trays (HDG)** HDG trays are fabricated first and then dipped into molten zinc, creating a thick, uniform coating of 65-85 microns that covers all edges, holes, and corners. This process provides long-term corrosion resistance, making HDG trays ideal for outdoor, coastal, or industrial environments exposed to rain, salt air, or chemicals. They can last 20 years or more without significant maintenance .
- **GI (Galvanized Iron) Cable Trays** GI trays are another form of galvanized steel, often used interchangeably with pre-galvanized trays. They provide moderate corrosion protection and are suitable for general indoor applications .

Material Properties and Benefits

- **Corrosion Resistance:** Zinc coating acts as a sacrificial layer, forming a protective...
