

How should the lighting distribution box be arranged

Article Overview

A lighting distribution box should be arranged with separate circuits, clearly labeled busbars, and neatly organized wiring to ensure safety, accessibility, and efficient operation.

Placement and Accessibility

The distribution box should be installed in a dry, ventilated, and easily accessible area, typically at a height of 0.8–1.2 meters from the floor, and 50–100 mm above the ground if floor-mounted . Avoid placing it in areas where it obstructs movement or interferes with performance spaces, especially for stage or outdoor lighting . For outdoor installations, ensure the box is rainproof and dustproof, using IP66 or NEMA 4X rated enclosures .

Circuit Separation

- Separate lighting and power circuits to prevent interference and simplify maintenance .
- Divide lighting into zones or rooms, such as indoor vs. outdoor lighting, or circuits controlled by timers or motion sensors .
- Each circuit should have its own protective device, such as a breaker or fuse, to disconnect safely in case of overload or short circuit .
