

How to add ammonia to the outdoor server rack

Article Overview

Ammonia should never be added to a server rack; use approved cooling and fire suppression systems instead.

Outdoor server racks require careful management of temperature, humidity, and fire risk. Ammonia is highly toxic and corrosive, making it unsafe for use in or around electronic equipment. Introducing ammonia could damage servers, wiring, and other components, and pose serious health hazards.

Recommended Cooling Methods

- Active cooling systems: Use air conditioners or heat exchangers integrated into the outdoor cabinet to maintain optimal temperatures and prevent overheating .
- Forced convection: Fans or blowers can improve airflow, pushing hot air out and drawing cool air in .
- Passive cooling: For low-density setups, natural airflow can help, but it is less effective in harsh outdoor conditions .
- Thermal management planning: Proper layout and airflow design can improve cooling efficiency by up to 30% .

Fire Suppression Options

- Clean agent systems: Use gases like 3M Novec 1230 or HFC-based agents, which safely extinguish fires without damaging electronics
