

How to calculate the cost of fiber optic pigtail patch cords

Article Overview

Fiber optic patch cord and pigtail costs are calculated by combining the required quantity, cable type, connector type, length, and additional features such as armoring or jacket material.

Step 1: Determine Quantity Needed

The first step is to calculate how many patch cords or pigtails your network requires. Key factors include:

- **Network Topology:** Star topologies require more patch cords than ring or bus topologies.
- **Device Ports:** Count the number of fiber ports on switches, servers, and other devices. For example, a 24-port switch requires at least 24 patch cords, plus additional units for redundancy .
- **Patch Panel Design:** Cross-connect setups need cords between devices and patch panels, as well as between panels themselves.
- **Redundancy and Spare Cords:** Include 10-20% extra for spares and 15-30% for future expansion . A practical formula is: $\text{Total patch cords} = (\text{Ports on Device A} + \text{Ports on Device B}) \times (1 + \text{Redundancy factor})$ For pigtails (connector on one end only), the calculation is similar, but they are typically used for splicing to bare fiber, so quantity depends on the number of fiber terminations.

Step 2: Identify Cable and Connector Specifications...
