

Installation of Double-Layer Cable Trays in Andorra

Article Overview

Double-layer cable trays should be installed following European standards, ensuring proper support, spacing, and safety for multi-tiered cable management systems.

Planning and Design

Before installation, a detailed layout plan must be prepared, showing the location, length, and routing of both layers of cable trays. The system designer or engineer should consider:

- Load capacity for each tray layer, including the weight of cables and fittings
 - Clearances between layers to allow heat dissipation and maintenance access
 - Support structures such as brackets, struts, or threaded rods to secure both layers
 - Compliance with European standards like DIN EN 61537 or BS EN 61537 for cable support systems
- Double-layer trays are typically used in electrical rooms, plant rooms, or service corridors where multiple cable circuits need separation and organization.

Material Selection

Cable trays can be made from steel, stainless steel, or aluminum, with finishes such as galvanization or powder coating to resist corrosion. For Andorra's climate, galvanized steel or stainless steel is recommended for durability and long-term performance
