

Main line binding of distribution box

Article Overview

Main line binding in a distribution box involves securely organizing and tying the incoming phase, neutral, and earth wires to ensure safety, neatness, and compliance with electrical standards.

Incoming Main Line Connection

The main power supply, consisting of phase (live) and neutral wires, is first connected to the main circuit breaker (MCB) or main switch. In single-phase systems, a double-pole MCB is typically used as the main switch, rated according to the total load, often 63A for domestic installations. The output of the main MCB is then connected to the RCCB (Residual Current Circuit Breaker) if used, which provides protection against leakage currents and electrical shocks. The neutral wire is routed to a neutral busbar, and the earth wire is connected to the earth busbar.

Wire Arrangement and Binding

Inside the distribution box, wires should be neatly arranged to prevent tangling and ensure easy maintenance. Standard practices include:

- Wire routing: Main incoming wires are routed on the left side of the box, while outgoing branch wires are routed to the right.
- Wire color coding: Phase wires are typically red, yellow, or green depending on the phase; neutral is blue; earth is green/yellow.
- Wire specification: Choose wire gauge according to load; e.g., 2.5mm² for lighting and sockets, 4mm² for high-power appliances
