

Multi-hole cable tray processing and manufacturing

Article Overview

Multi-hole cable trays are produced using automated roll forming, CNC punching, and hybrid mesh techniques to ensure precise hole patterns, structural integrity, and efficient ventilation.

Manufacturing Process

1. Material Preparation: Production begins with metal coils, typically galvanized steel, stainless steel, or aluminum, with thicknesses ranging from 0.4 mm to 3.0 mm depending on tray type and load requirements . The coils are decoiled and leveled to remove internal stresses and ensure flatness . 2. Punching and Perforation: CNC punching machines or hydraulic punch presses create the multi-hole patterns. These holes allow for ventilation, drainage, and cable cooling, and can be customized in size, spacing, and arrangement to meet project specifications . Precision molds ensure consistent hole alignment and structural safety. 3. Roll Forming: The punched metal sheets are fed through a roll forming line, which progressively shapes the material into U-channel, C-channel, ladder, or hybrid mesh profiles . Fully automated lines integrate servo feeding, continuous punching, and roll forming to maintain tight tolerances (± 0.2 –1 mm) and consistent profile angles . 4. Secondary Operations: Press brakes and bending machines are used for flanges, brackets, elbows, tees, and reducers. Shearing or flying shear systems cut the trays to precise lengths without distorting the profile . Fiber laser or hydraulic shearing machines may be used for blanks in complex designs. 5. Finishing and Quality Control: Trays can be galvanized, powder-coated, or made from stainless steel for corrosion resistance. Automated w...
