

Production speed of molded cable trays

Article Overview

Molded cable trays can be produced at speeds ranging from 2.5 to 40 meters per minute, depending on material, profile complexity, and automation level.

Roll Forming Production Speeds

Cable trays are commonly manufactured using roll forming lines, which allow continuous shaping of steel strips into tray profiles. Typical production speeds for roll forming vary based on material thickness and tray complexity:

- Continuous molding speed: 10-25 meters per minute for standard steel trays with thicknesses of 1-2.5 mm .
- High-volume production: 10-40 meters per minute, depending on profile complexity and material type .
- Online punching during forming: 2.5-5 meters per minute when holes or slots are punched simultaneously with forming .

Factors Affecting Production Speed

- Material Thickness: Thicker steel slows down forming and punching operations. Typical thickness ranges from 0.4 mm to 2.5 mm .
- Tray Profile Complexity: Simple ladder or channel trays can be produced faster, while trays with multiple bends, flanges, or perforations require slower speeds .
- Automation Level: Fully automated lines with servo feeding, CNC punching, and synchronized cutting achieve higher speeds and consistent quality compared to semi-automatic or manual setups .
- Secondary Operations: Press brake bending, flange forming, or fitting attachment...
