

Sensitivity Experiment of Optical Receiver

Overview

We experimentally demonstrate enhanced sensitivity of an atom-based Rydberg radio frequency (RF) receiver integrated with a gradient refractive index (GRIN) Luneburg-type metamaterial lens. To make a good optical receiver design, it is critical to understand the. Bit Error Ratio (BER) In digital communication systems, the decision when to sample and whether the sampled value represents a binary 1 or 0 is affected by noise and signal distortion in the real system and there is nonzero probability of an erroneous decision. The standards body governing the application sets this specified BER. Test setups often include signal generators, attenuators, and BER analyzers for. Minimum Receiver Power (sometimes referred to as Receiver Minimum Input Power) is the lowest level of optical power at which the module is guaranteed to operate without exceeding a specified bit error rate (typically $BER \leq 10^{-12}$). By analyzing the electromagnetically induced transparency (EIT) effect in Cesium vapor, we compare receiver.
