

Standard Wiring Diagram for the Bottom of the Main Distribution Box

Article Overview

The bottom of a main distribution box typically houses the main and output circuit breakers, RCCBs, neutral and earth bars, with phase, neutral, and earth wires connected according to a standard layout.

Key Components in the Bottom Panel

- **Main MCB (Double Pole):** This is the main switch controlling the entire supply to the distribution board. The incoming phase and neutral wires from the utility or energy meter are connected to this breaker. It allows complete isolation of the electrical system for maintenance or emergencies .
- **RCCB / RCD (Residual Current Device):** Positioned after the main MCB, the RCCB protects against leakage currents and electric shocks. The output of the main MCB feeds into the RCCB input, and its output then supplies the downstream MCBs .
- **Output MCBs (Single or Double Pole):** These breakers distribute power to individual circuits such as lighting, sockets, or appliances. Single-pole MCBs are used for standard loads, while double-pole MCBs may be used for high-power or special loads .
- **Neutral Bar:** All neutral wires from the output circuits are connected here. The neutral from the main supply is also linked to this bar, ensuring a common return path for all circuits .
- **Earth Bar:** All protective earth wires from the circuits and the main supply are connected to this bar. Proper earthing ensures safety and prevents electric shock .
