

Standard wiring diagram for indoor electrical distribution box

Article Overview

A standard indoor distribution box wiring diagram typically includes a main MCB, RCD/RCCB, individual circuit breakers, neutral and earth busbars, and clearly labeled connections for safe and code-compliant distribution.

Key Components and Layout

- **Main Switch / MCB:** The main circuit breaker (usually double-pole for single-phase systems) receives the incoming supply and protects the entire distribution board. Typical domestic ratings are 63A for single-phase installations ().
- **RCD / RCCB:** Provides protection against earth leakage, electrical shock, and insulation faults. The RCD is connected downstream of the main MCB, with its output feeding the individual circuit breakers. A 30mA sensitivity is standard for domestic setups ().
- **Individual Circuit Breakers (MCBs):** Single-pole MCBs are used for lighting and general-purpose outlets, while double-pole MCBs may be used for high-power appliances. Each MCB is connected to the neutral and earth busbars ().
- **Busbars and Terminal Blocks:** Neutral and earth busbars distribute the respective conductors to all circuits. Terminal blocks are used for neat connections and proper labeling ().
- **Wiring and Color Codes:** Live (phase) wires are typically red or brown, neutral wires are black or blue, and earth wires are green/yellow. Conductor sizes should match the load and breaker ratings ().
