

The network is slow when using a router connected to fiber optic cable

Article Overview

Slow speeds on a fiber-optic connection are often caused by router limitations, Wi-Fi interference, network congestion, or cable and configuration issues.

Common Causes

1. Router Limitations: Older or low-quality routers may not handle the high speeds of fiber connections or support multiple devices simultaneously. Upgrading to a modern router designed for gigabit speeds can significantly improve performance . 2. Wi-Fi Interference and Distance: Even with fiber, the signal is converted to Wi-Fi for your devices. Distance from the router, thick walls, or interference from other electronics can weaken the signal, reducing speed . 3. Network Congestion: High usage in your area or multiple devices in your home streaming, gaming, or downloading simultaneously can slow your connection. Peak hours often exacerbate this issue . 4. Cable and Hardware Issues: Damaged, loose, or outdated Ethernet cables (Cat 5 instead of Cat 6 or higher) can limit speeds. Faulty transceivers, switches, or connectors can also cause slowdowns . 5. Configuration and Software Problems: IP conflicts, outdated firmware, or background applications consuming bandwidth can reduce speed. Malware or hidden programs may also use network resources without your knowledge .

Practical Solutions

- Restart your router to clear temporary glitches
