

The optical module can be electrically disconnected

Overview

To remove the optical module, first unplug the fiber jumper, then flip open the pull-tab on the module and pull it out horizontally. An optical module is a typically hot-pluggable optical transceiver used in high-bandwidth data communications applications. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. The transmit optical bore inputs electrical signals at a certain bit rate, which are then processed by the internal driver chip. After the processing, the drive's semiconductor laser diode (LD) or light emitting diode (LED) emits modulated optical signals at the corresponding rate. However, during installation and daily operation, various issues may arise.
