

# Thickness of the protective layer of the primary distribution box

## Article Overview

The protective layer or sheet metal of a primary distribution box typically ranges from 1.5 mm to 2.0 mm, depending on the type, size, and installation environment.

### Standard Thickness Guidelines

- **Power Distribution Boxes:** For primary distribution boxes that handle significant load currents and may experience mechanical or electrodynamic stresses, the sheet metal thickness is generally not less than 1.5 mm, with larger or high-capacity boxes often using 2.0 mm or thicker steel plates to ensure structural integrity and protection performance .
- **Lighting or Control Boxes:** For smaller boxes controlling lighting circuits, thickness can be slightly lower. Boxes larger than 600 mm typically use 2.0 mm cold-rolled steel, while smaller boxes may use 1.5 mm .
- **Mounting Strips and Internal Components:** Components inside the box, such as CRCA MS mounting strips, are usually 2 mm thick to provide adequate support for electrical devices .
- **Earth Clamps and Cable Glands:** Protective elements like earth clamps have a thickness of 2 mm, and rubber glands for cable entry have a minimum thickness of 1 mm to maintain insulation and safety .

### Factors Affecting Thickness Selection

- **Size and Weight of the Box:** Larger boxes require thicker metal to prevent deformation under their own weight or the weight of installed equipment. For exam...
