

What is an external optical fiber cable

Overview

Fiber optic cables are a type of networking cable that uses light to transmit data. Unlike traditional copper cables that use electrical signals, fiber optics rely on pulses of light to carry information, making them faster and more efficient over long distances. These fibres, when encased in protective materials, become. Unlike copper wires, which are limited by lower data transmission speeds, shorter transmission distances, and higher susceptibility to electromagnetic interference, fiber optic cables offer unparalleled performance and can cover much greater distances without bumping up against signal degradation. What is an Optical Fiber?

Optical fiber is a technology used to transmit data by sending short light pulses along a long fiber, which is typically made of glass or plastic. These cables work based on the principle of light refraction, which allows them to carry information across long distances, unlike regular copper wires, which use electrical signals.
