

What type of board is used for cable trays

Article Overview

Cable trays typically use solid, ventilated, or ladder-type boards made from steel, aluminum, or other corrosion-resistant materials depending on load, environment, and cable type.

Types of Boards for Cable Trays

1. Ladder-Type Boards Ladder trays consist of two longitudinal side rails connected by transverse rungs, forming a ladder-like structure. They are ideal for power cables because they allow heat dissipation, support heavy loads over long spans, and maintain proper cable spacing. Rung spacing is commonly 6 to 12 inches, depending on cable size and weight . 2. Solid or Perforated Boards Solid-bottom trays provide full support for cables, protecting them from dust, debris, and mechanical damage. Perforated or ventilated boards allow airflow, reducing heat buildup while still supporting the cables. These are often used for instrumentation, control, or communication cables where additional protection is needed . 3. Wire Mesh or Channel Boards Wire mesh trays are made of high-strength steel wire and are suitable for lightweight cables or installations requiring flexibility and easy access. Channel trays, with a solid or ventilated bottom, are used where visual aesthetics or electromagnetic interference protection is important .

Material Considerations

- Steel: Strong and durable, often galvanized or stainless for corrosion resistance. S...
