

Which wall is best for fiber optic cable installation

Article Overview

Smooth, stable walls such as drywall, plaster, or finished wood are generally best for fiber optic cable installation, provided the surface allows secure attachment without sharp edges or excessive bending.

Wall Material Considerations

Drywall or plaster walls are ideal for indoor fiber optic cable runs because they are smooth, easy to drill or attach clips to, and allow for secure mounting without damaging the cable jacket . Finished wood walls are also suitable, offering a stable surface for cable clips or Velcro straps, but care must be taken to avoid splitting the wood or over-tightening fasteners . Avoid rough, uneven, or abrasive surfaces such as exposed brick, concrete, or cinder block unless the cable is protected with conduit or innerduct, as these surfaces can damage the cable jacket during installation .

Mounting and Protection

- Use soft Velcro straps or specialized fiber cable clips to secure the cable to the wall, avoiding plastic zip ties that can crush the cable .
- Maintain the minimum bend radius of the fiber cable, typically at least 1.5 inches for standard indoor patch cables, to prevent signal loss or fiber breakage .
- For vertical runs, support the cable at regular intervals to prevent the weight from exceeding the long-term load rating .
- Consider using innerduct or flexible conduit in high-traffic areas or where the wall...
