

White tube through which ODF fiber optic cable runs

Article Overview

The white tube through which an ODF fiber optic cable runs is typically a protective buffer or conduit that safeguards the optical fibers, maintains bend radius, and facilitates organized routing within the ODF.

Purpose of the White Tube

In fiber optic systems, the white tube acts as a protective layer around the delicate optical fibers. It prevents mechanical damage, minimizes stress during installation, and maintains the proper bend radius to avoid signal loss or fiber breakage . This tube is often made of durable plastic materials and is part of the cable's internal structure, ensuring that fibers remain intact when routed through ODFs, patch panels, or conduits .

Role in ODF Management

Within an Optical Distribution Frame (ODF), fibers are terminated, spliced, and organized. The white tube allows fibers to be easily routed through splice trays, patch panels, and cable management rings without tangling or being exposed to environmental hazards . It also simplifies maintenance and troubleshooting by keeping fibers grouped and identifiable, often with labeling applied near connectors .
